Hello,

I am a former computer science tutor seeking to make a transition into software engineering. I have been learning to code since I was a child, first applying my skills to game development, then joining the robotics team in high school, and eventually teaching computer science and robotics classes as my full-time job. My experience and desire to keep learning deeper and improving as an engineer is something I would love to bring to Cisco

In order to continue my journey, I joined an intensive software development bootcamp where I learned how to design, build and deploy full stack web applications using languages such as JavaScript, Python, SQL, HTML and CSS as well as frameworks that expanded upon them such as React, Redux, express.js, node.js, Flask, and Postgres. During this bootcamp I completed four projects that required making full use of all of these. The EarFruit project I worked on with three of my classmates showcases my ability to work on a team under a time crunch, as well as my proficiency at creating interactive front ends with React and working with API's.

In addition to the aforementioned skills, I have experience in fast paced, team based environments. In previous positions I had to learn new systems and technologies quickly and implement systems of my own based on them. I am looking forward to contributing and hitting the ground running with your great team at Cisco and hope to hear from you soon.

Respectfully,

Krishna Mulloth
